

Outdoor Activity 1

1. Selected Problem Statement:

Doctor Appointment System

- People often face difficulties while booking appointments with doctors. They may have to call the hospital or clinic, wait for confirmation, or visit the hospital personally to book an appointment.
- Sometimes, patients are also not sure about the doctor's availability, consultation timings, fees, or whether the appointment has been successfully booked.
- The main problem is that there is no simple and convenient way for patients to check doctor availability and book an appointment according to their preferred time. Our idea is to create a platform where users can easily find doctors, view available time slots, and book appointments online.

2. Target Users:

- Our target users are patients, college students, working people, and people who book appointments for themselves or their family members.
- These users may face difficulties with traditional appointment booking methods and can help us understand what they expect from an online doctor appointment system.

3. Research Location:

- The research was conducted within the college campus. We interacted with booking doctor appointments.
- The purpose was to understand the problems they face while finding doctors, checking availability, and booking appointments.

4. Interview Questions:

We asked students the following questions:

1. How do you usually book a doctor's appointment?
2. What problems do you face while booking an appointment?
3. How do you check whether a doctor is available?
4. What information do you want to know before booking an appointment?
5. Have you ever faced long waiting times at a hospital or clinic?
6. What would make online appointment booking easier for you?
7. What features would you expect in a doctor appointment system?
8. Would appointment reminders and notifications be useful to you? Why?

5. User Responses:

- Most students said that they or their family members usually book appointments through phone calls or by visiting the hospital or clinic.
- Students felt that checking the doctor's availability and getting a suitable time slot can sometimes be difficult.
- Some students mentioned that they have experienced long waiting times even after reaching the hospital for an appointment.
- Students felt that having information such as the doctor's specialization, consultation fee, available timings, and location in one place would make the process easier.
- They also felt that online booking, appointment reminders, and notifications about changes in the appointment would be useful.
- Overall, students preferred a system that is quick, simple, and easy to use.

6. User Observations:

- During the interactions, we noticed that students were familiar with using online platforms for different services and were comfortable with the idea of online appointment booking.
- We observed that convenience and time-saving were important factors for users. Students preferred being able to check available slots before visiting a hospital or clinic.
- We also observed that users wanted clear information about doctors and appointments before making a booking.
- A reminder or notification system could also help users remember their appointments and avoid missing them.

7. Pain Points:

- The first major pain point is the difficulty of booking appointments through traditional methods such as phone calls or visiting the hospital.
- Another problem is that users may not know the doctor's available time slots before booking an appointment.
- Long waiting times at hospitals and clinics can also make the overall experience inconvenient.
- Users may not have all the required information about the doctor, such as specialization, consultation fee, location, and timings.
- Users may also forget their appointment dates or timings if they do not receive proper reminders.
- Rescheduling or cancelling an appointment can also be inconvenient when it requires contacting the hospital again.

8. Key Insights:

- Many users prefer online appointment booking because it can save time and reduce the need for phone calls or unnecessary visits to the hospital.
- Users feel that showing the doctor's availability, time slots, fees, specialization, and location would help them make better decisions before booking.
- Appointment reminders and notifications can improve the user experience by helping patients remember their appointments and stay updated.
- A simple and user-friendly system with easy booking, cancellation, and rescheduling options could make the appointment process more convenient.
